Revision	Details	Date
Rev 1.0	Initial Release	Aug 2020
Rev 1.1	Updates in Table.1, Table.27, 28 & MR1 notes	Mar 2021

# 1 Overview

The LPDDR4 SDRAM is organized as 1 or 2 channels per device, and individual channel is 8-banks and 16-bits. This product uses a double-data-rate architecture to achieve high-speed operation. The double data rate architecture is essentially a 16n prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. This product offers fully synchronous operations referenced to both rising and falling edges of the clock. The data paths are internally pipelined and 16n bits prefetched to achieve very high bandwidth.

## 1.1 Features

The 2Gb/4Gb/8Gb LPDDR4 SDRAM offers the following key features:

- Configuration:
  - x32 for 2-channels per device (AS4C64M32MD4 , AS4C128M32MD4, AS4C256M32MD4)
  - x16 for 1-channel per device (AS4C128M16MD4, AS4C256M16MD4)
  - 8 internal banks per each channel
- On-Chip ECC:
  - Single-bit error correction (per 64-bits), which will maximize reliability
  - Optional ERR output signal per channel, which indicates ECC event occurrence
  - ECC Register, which controls ECC function
- Low-voltage Core and I/O Power Supplies:
  - $V_{DD2}/V_{DDQ} = 1.06-1.17V$ ,  $V_{DD1} = 1.70-1.95V$
- LVSTL(Low Voltage Swing Terminated Logic) I/O Interface
- Internal VREF and VREF Training
- Dynamic ODT :
  - DQ ODT :VSSQ Termination
  - CA ODT :VSS Termination
- Selectable output drive strength (DS)
- Max. Clock Frequency : 1.6GHz (3.2Gbps for one channel)
- 16-bit Pre-fetch DDR data bus
- Single data rate (multiple cycles) command/address bus
- Bidirectional/differential data strobe per byte of data (DQS,  $\overline{DQS}$ )
- DMI pin support for write data masking and DBI functionality
- Programmable READ and WRITE latencies (RL/WL)
- Programmable and on-the-fly burst lengths (BL =16, 32)
- Support non-target DRAM ODT control
- Directed per-bank refresh for concurrent bank operation and ease of command scheduling
- ZQ calibration
- Operation Temperature:
  - Automotive A2 ( $T_C = -40^{\circ}C$  to  $105^{\circ}C$ )
- On-chip temperature sensor to control self refresh rate
- On-chip temperature sensor whose status can be read from MR4
- RoHS-compliant “green” packaging
- Package:
  - 2Gb/4Gb : 200 ball FBGA (10mm x 14.5mm x 0.8mm)
  - 8Gb : 200 ball FBGA (10mm x 14.5mm x 1.1mm)

Burst Starting Address Boundary		64-bit	64-bit	64-bit	64-bit	64-bit

NOTE 1 The lower two column addresses (C0 - C1) are assumed to be "zero" and are not transmitted on the CA bus.

NOTE 2 Row and Column address values on the CA bus that are not used for a particular density be at valid logic levels.

NOTE 3 For non - binary memory densities, only half of the row address space is valid. When the MSB address bit is "HIGH", then the MSB - 1 address bit must be "LOW".

NOTE 4 The row address input which violates restriction described in note 3 may result in undefined or vendor specific behavior. Consult memory vendor for more information.

## 1.6 Pin Functional Description

**Table 5 - Pin Functional Description**

Symbol	Type	Function
CK_t_A, CK_c_A, CK_t_B, CK_c_B	Input	<b>Clock:</b> CK_t and CK_c are differential clock inputs. All address, command, and control input signals are sampled on the crossing of the positive edge of CK_t and the negative edge of CK_c. AC timings for CA parameters are referenced to CK. Each channel (A & B) has its own clock pair.
CKE_A CKE_B	Input	<b>Clock Enable:</b> CKE HIGH activates and CKE LOW deactivates the internal clock circuits, input buffers, and output drivers. Power-saving modes are entered and exited via CKE transitions. CKE is part of the command code. Each channel (A & B) has its own CKE signal.
CS_A CS_B	Input	<b>Chip Select:</b> CS is part of the command code. Each channel (A & B) has its own CS signal.
CA[5:0]_A CA[5:0]_B	Input	<b>Command/Address Inputs:</b> CA signals provide the Command and Address inputs according to the Command Truth Table. Each channel (A&B) has its own CA signals.
ODT_CA_A ODT_CA_B	Input	<b>CA ODT Control:</b> The ODT_CA pin is used in conjunction with the Mode Register to turn on/off the On-Die-Termination for CA pins.
DQ[15:0]_A, DQ[15:0]_B	I/O	<b>Data Input/Output:</b> Bi-direction data bus.
DQS[1:0]_t_A, DQS[1:0]_c_A, DQS[1:0]_t_B, DQS[1:0]_c_B	I/O	<b>Data Strobe:</b> DQS_t and DQS_c are bi-directional differential output clock signals used to strobe data during a READ or WRITE. The Data Strobe is generated by the DRAM for a READ and is edge-aligned with Data. The Data Strobe is generated by the Memory Controller for a WRITE and must arrive prior to Data. Each byte of data has a Data Strobe signal pair. Each channel (A & B) has its own DQS strobes.
DMI[1:0]_A, DMI[1:0]_B	I/O	<b>Data Mask Inversion:</b> DMI is a bi-directional signal which is driven HIGH when the data on the data bus is inverted, or driven LOW when the data is in its normal state. Data Inversion can be disabled via a mode register setting. Each byte of data has a DMI signal. Each channel (A & B) has its own DMI signals. This signal is also used along with the DQ signals to provide write data masking information to the DRAM. The DMI pin function - Data Inversion or Data mask - depends on Mode Register setting.
ZQ	Reference	<b>Calibration Reference:</b> Used to calibrate the output drive strength and the termination resistance. There is one ZQ pin per die. The ZQ pin shall be connected to V <sub>DDQ</sub> through a 240Ω ± 1% resistor.
V <sub>DDQ</sub> , V <sub>DD1</sub> , V <sub>DD2</sub>	Supply	<b>Power Supplies:</b> Isolated on the die for improved noise immunity.
VSS, VSSQ	GND	<b>Ground Reference:</b> Power supply ground reference.
RESET_n	Input	<b>RESET:</b> When asserted LOW, the RESET_n signal resets all channels of the die. There is one RESET_n pad per die.

NOTE 1 "\_A" and "\_B" indicate DRAM channel "\_A" pads are present in all devices. "\_B" pads are present in dual channel SDRAM devices only.

## 1.7 Power-up, Initialization and Power-off Procedure

For power-up and reset initialization, in order to prevent DRAM from functioning improperly, default values of the following MR settings are defined as [Table 6](#).

**Table 6 - MRS defaults settings**

Item	MRS	Default Setting	Description
FSP-OP/WR	MR13 OP[7:6]	00 <sub>B</sub>	FSP-OP/WR[0] are enabled
WLS	MR2 OP[6]	0 <sub>B</sub>	Write Latency Set 0 is selected
WL	MR2 OP[5:3]	000 <sub>B</sub>	WL = 4
RL	MR2 OP[2:0]	000 <sub>B</sub>	RL = 6, nRTP=8
nWR	MR1 OP[6:4]	000 <sub>B</sub>	nWR = 6
DBI-WR/RD	MR3 OP[7:6]	00 <sub>B</sub>	Write & Read DBI are disabled
CA ODT	MR11 OP[6:4]	000 <sub>B</sub>	CA ODT is disabled
DQ ODT	MR11 OP[2:0]	000 <sub>B</sub>	DQ ODT is disabled
V <sub>REF</sub> (CA) Setting	MR12 OP[6]	1 <sub>B</sub>	V <sub>REF</sub> (CA) Range[1] enabled
V <sub>REF</sub> (CA) Value	MR12 OP[5:0]	001101 <sub>B</sub>	Range1 : 27.2% of V <sub>DD2</sub>
V <sub>REF</sub> (DQ) Setting	MR14 OP[6]	1 <sub>B</sub>	V <sub>REF</sub> (DQ) Range[1] enabled
V <sub>REF</sub> (DQ) Value	MR14 OP[5:0]	001101 <sub>B</sub>	Range1 : 27.2% of V <sub>DDQ</sub>

### 1.7.1 Voltage Ramp and Device Initialization

The following sequence shall be used to power up the LPDDR4 device. Unless specified otherwise, these steps are mandatory. Note that the power-up sequence of all channels must proceed simultaneously.

1. While applying power (after  $T_a$ ), RESET<sub>n</sub> is recommended to be LOW ( $\leq 0.2 \times V_{DD2}$ ) and all other inputs must be between VILmin and VIHmax. The device outputs remain at High-Z while RESET<sub>n</sub> is held LOW. Power supply voltage ramp requirements are provided in [Table 7](#). V<sub>DD1</sub> must ramp at the same time or earlier than V<sub>DD2</sub>. V<sub>DD2</sub> must ramp at the same time or earlier than V<sub>DDQ</sub>.

**Table 7 - Voltage Ramp Conditions**

After	Applicable Conditions
T <sub>a</sub> is reached	V <sub>DD1</sub> must be greater than V <sub>DD2</sub>
	V <sub>DD2</sub> must be greater than V <sub>DDQ</sub> - 200 mV

NOTE 1 T<sub>a</sub> is the point when any power supply first reaches 300 mV.

NOTE 2 Voltage ramp conditions in Table 8 apply between T<sub>a</sub> and power-off (controlled or uncontrolled).

NOTE 3 T<sub>b</sub> is the point at which all supply and reference voltages are within their defined ranges.

NOTE 4 Power ramp duration tINIT0 (T<sub>b</sub>-T<sub>a</sub>) must not exceed 20ms.

NOTE 5 The voltage difference between any of V<sub>SS</sub> and V<sub>SSQ</sub> pins must not exceed 100 mV.

2. Following the completion of the voltage ramp (T<sub>b</sub>), RESET<sub>n</sub> must be maintained LOW. DQ, DMI, DQS<sub>t</sub> and DQS<sub>c</sub> voltage levels must be between V<sub>SSQ</sub> and V<sub>DDQ</sub> during voltage ramp to avoid latch-up. CE, CK<sub>t</sub>, CK<sub>c</sub>, CS<sub>n</sub> and CA input levels must be between V<sub>SS</sub> and V<sub>DD2</sub> during voltage ramp to avoid latch-up.
3. Beginning at T<sub>b</sub>, RESET<sub>n</sub> must remain LOW for at least tINIT1(T<sub>c</sub>), after which RESET<sub>n</sub> can be deasserted to HIGH(T<sub>c</sub>). At least 10ns before RESET<sub>n</sub> de-assertion, CE is required to be set LOW. All other input signals are "Don't Care".

### 1.7.1 Voltage Ramp and Device Initialization (cont'd)

NOTES: 1. Training is optional and may be done at the system architect's discretion. The training sequence after ZQ\_CAL Latch (Th, Sequence 7~9) in Figure 5 is simplified recommendation and actual training sequence may vary depending on systems.

**Figure 5 - Power Ramp and Initialization Sequence**

4. After RESET<sub>n</sub> is de-asserted (T<sub>c</sub>), wait at least t<sub>INIT3</sub> before activating CKE. Clock (CK<sub>t</sub>, CK<sub>c</sub>) is required to be started and stabilized for t<sub>INIT4</sub> before CKE goes active (T<sub>d</sub>). CS is required to be maintained LOW when controller activates CKE.
5. After setting CKE high, wait minimum of t<sub>INIT5</sub> to issue any MRR or MRW commands (T<sub>e</sub>). For both MRR and MRW commands, the clock frequency must be within the range defined for t<sub>CKb</sub>. Some AC parameters (for example, t<sub>DQSCk</sub>) could have relaxed timings (such as t<sub>DQSCk</sub>) before the system is appropriately configured.
6. After completing all MRW commands to set the Pull-up, Pull-down and Rx termination values, the DRAM controller can issue ZQCAL Start command to the memory (T<sub>f</sub>). This command is used to calibrate V<sub>OH</sub> level and output impedance over process, voltage and temperature. In systems where more than one LPDDR4 DRAM devices share one external ZQ resistor, the controller must not overlap the ZQ calibration sequence of each LPDDR4 device. ZQ calibration sequence is completed after t<sub>ZQCAL</sub> (T<sub>g</sub>) and the ZQCAL Latch command must be issued to update the DQ drivers and DQ+CA ODT to the calibrated values.
7. After t<sub>ZQLAT</sub> is satisfied (T<sub>h</sub>) the command bus (internal VREF(CA), CS, and CA) should be trained for high-speed operation by issuing an MRW command (Command Bus Training Mode). This command is used to calibrate the device's internal VREF and align CS/CA with CK for high-speed operation. The LPDDR4 device will power-up with receivers configured for low-speed operations, and VREF(CA) set to a default factory setting. Normal device operation at clock speeds higher than t<sub>CKb</sub> may not be possible until command bus training has been completed.

NOTE The command bus training MRW command uses the CA bus as inputs for the calibration data stream, and outputs the results asynchronously on the DQ bus. See 4.29, (item 1.), MRW for information on how to enter/exit the training mode.

8. After command bus training, DRAM controller must perform write leveling. Write leveling mode is enabled when MR2 OP[7] is high (T<sub>i</sub>). See 4.31, Mode Register Write-WR Leveling Mode, for detailed description of write leveling entry and exit sequence. In write leveling mode, the DRAM controller adjusts write DQS<sub>t/c</sub> timing to the point where the LPDDR4 device recognizes the start of write DQ data burst with desired write latency.
9. After write leveling, the DQ Bus (internal VREF(DQ), DQS, and DQ) should be trained for high-speed operation using the MPC training commands and by issuing MRW commands to adjust VREF(DQ) (T<sub>j</sub>). The LPDDR4 device will power-up with receivers configured for low-speed operations and VREF(DQ) set to a default factory setting. Normal device operation at clock speeds higher than t<sub>CKb</sub> should not be attempted until DQ Bus training has been completed. The MPC Read Calibration command is used together with MPC FIFO Write/Read commands to train

DQ bus without disturbing the memory array contents. See DQ Bus Training section for detailed DQ Bus Training sequence.

- At  $t_{CKb}$  the LPDDR4 device is ready for normal operation, and is ready to accept any valid command. Any more registers that have not previously been set up for normal operation should be written at this time.

**Table 8 - Initialization Timing Parameters**

Parameter	Value		Unit	Comment
	Min	Max		
$t_{INIT0}$	-	20	ms	Maximum voltage-ramp time
$t_{INIT1}$	200	-	us	Minimum RESET_n LOW time after completion of voltage ramp
$t_{INIT2}$	10	-	ns	Minimum CKE low time before RESET_n high
$t_{INIT3}$	2	-	ms	Minimum CKE low time after RESET_n high
$t_{INIT4}$	5	-	tCK	Minimum stable clock before first CKE high
$t_{INIT5}$	2	-	us	Minimum idle time before first MRW/MRR command
$t_{ZCAL}$	1	-	us	ZQ calibration time
$t_{ZLAT}$	Max(30ns, 8tCK)	-	ns	ZQCAL latch quiet time.
$t_{CKb}$	Note *1,2	Note *1,2	ns	Clock cycle time during boot

NOTE 1 Min tCKb guaranteed by DRAM test is 18 ns.

NOTE 2 The system may boot at a higher frequency than dictated by min tCKb. The higher boot frequency is system dependent.

### 1.7.2 Reset Initialization with Stable Power

The following sequence is required for RESET at no power interruption initialization.

- Assert RESET\_n below  $0.2 \times V_{DD2}$  anytime when reset is needed. RESET\_n needs to be maintained for minimum tPW\_RESET. CKE must be pulled LOW at least 10 ns before de-asserting RESET\_n.
- Repeat steps 4 to 10 in 1.6.1.

**Table 9 - Reset Timing Parameter**

Parameter	Value		Unit	Comment
	Min	Max		
tPW_RESET	100	-	ns	Minimum RESET_n low Time for Reset Initialization with stable power

### 1.7.3 Power-off Sequence

The following procedure is required to power off the device.

While powering off, CKE must be held LOW ( $0.2 \times V_{DD2}$ ) and all other inputs must be between  $V_{ILmin}$  and  $V_{IHmax}$ . The device outputs remain at High-Z while CKE is held LOW. DQ, DMI, DQS\_t and DQS\_c voltage levels must be between  $V_{SSQ}$  and  $V_{DDQ}$  during voltage ramp to avoid latch-up. RESET\_n, CK\_t, CK\_c, CS and CA input levels must be between  $V_{SS}$  and  $V_{DD2}$  during voltage ramp to avoid latch-up.

Tx is the point where any power supply drops below the minimum value specified.

Tz is the point where all power supplies are below 300mV. After Tz, the device is powered off.

**Table 10 - Power Supply Conditions**

After	Applicable Conditions
Tx and Tz	$V_{DD1}$ must be greater than $V_{DD2}$
	$V_{DD2}$ must be greater than $V_{DDQ} - 200$ mV

The voltage difference between any of  $V_{SS}$ ,  $V_{SSQ}$  pins must not exceed 100 mV.

### 1.7.4 Uncontrolled Power-off Sequence

When an uncontrolled power-off occurs, the following conditions must be met:

At Tx, when the power supply drops below the minimum values specified, all power supplies must be turned off and all power supply current capacity must be at zero, except any static charge remaining in the system.

After Tz (the point at which all power supplies first reach 300mV), the device must power off. During this period the relative voltage between power supplies is uncontrolled. VDD1 and VDD2 must decrease with a slope lower than 0.5 V/ $\mu$ s between Tx and Tz.

An uncontrolled power-off sequence can occur a maximum of 400 times over the life of the device.

## 1.8 Mode Register Definition

**Table 12** shows the mode registers for LPDDR4 SDRAM. Each register is denoted as "R" if it can be read but not written, "W" if it can be written but not read, and "R/W" if it can be read and written. A Mode Register Read command is used to read a mode register. A Mode Register Write command is used to write a mode register.

CATR	RFU	RFU	RZQI		RFU	Latency Mode	Refresh mode

Function	Register Type	Operand	Data	Notes
Refresh mode	Read-only	OP[0]	0B : Both legacy & modified refresh mode supported 1B : Only modified refresh mode supported	
Latency Mode		OP[1]	0B : Device supports normal latency 1B : Device supports byte mode latency	6,7
RZQI (Built-in Self-Test for RZQ)		OP[4:3]	00B: RZQ Self-Test Not Supported 01B: ZQ pin may connect to VSSQ or float 10B: ZQ-pin may short to VDDQ 11B: ZQ-pin Self-Test Completed, no error condition detected (ZQ-pin may not connect to VSSQ or float, nor short to VDDQ)	1,2,3,4
CATR (CA Terminating Rank)		OP[7]	0B: CA for this rank is not terminated 1B: Vendor specific	5

NOTE 1: RZQI MR value, if supported, will be valid after the following sequence:

- a. Completion of MPC ZQCAL Start command to either channel.
  - b. Completion of MPC ZQCAL Latch command to either channel then tZQLAT is satisfied.
- RZQI value will be lost after Reset.

NOTE 2: If the ZQ-pin is connected to VSSQ to set default calibration, OP[4:3] shall be set to 01B. If the ZQ-pin is not connected to VSSQ, either OP[4:3] = 01B or OP[4:3] = 10B might indicate a ZQ-pin assembly error. It is recommended that the assembly error is corrected.

NOTE 3: In the case of possible assembly error, the LPDDR4-SDRAM device will default to factory trim settings for RON, and will ignore ZQ Calibration commands. In either case, the device may not function as intended.

NOTE 4: If ZQ Self-Test returns OP[4:3] = 11B, the device has detected a resistor connected to the ZQ-pin. However, this result cannot be used to validate the ZQ resistor value or that the ZQ resistor tolerance meets the specified limits (i.e., 240Ω ± 1%).

NOTE 5: CATR functionality is Vendor specific. CATR can either indicate the connection status of the ODTCA pad for the die or whether CA for the rank is terminated. Consult the vendor device datasheet for details.

NOTE 6: See byte mode addendum spec for byte mode latency details.

NOTE 7: Byte mode latency for 2Ch. x16 device is only allowed when it is stacked in a same package with byte mode device.

RPST (RD Post-Ambles Length)		OP[7]	0B: RD Post-ambles = 0.5*tCK (default) 1B: RD Post-ambles = 1.5*tCK	4,5,6

NOTE 1: Burst length on-the-fly can be set to either BL=16 or BL=32 by setting the "BL" bit in the command operands. See the Command Truth Table.

NOTE 2: The programmed value of nWR is the number of clock cycles the LPDDR4-SDRAM device uses to determine the starting point of an internal Precharge operation after a Write burst with AP (auto-precharge) enabled.

NOTE 3: For Read operations this bit must be set to select between a "toggling" pre-ambles and a "Non-toggling" Pre-ambles. See 4.5, Read Preamble and Postambles, for a drawing of each type of pre-ambles.

NOTE 4: OP[7] provides an optional READ post-ambles with an additional rising and falling edge of DQS<sub>t</sub>. The optional postambles cycle is provided for the benefit of certain memory controllers.

NOTE 5: There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.

NOTE 6: There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. The device will operate only according to the values stored in the registers for the active set point, i.e., the set point determined by the state of the FSP-OP bit (MR13 OP[7]). The values in the registers for the inactive set point will be ignored by the device, and may be changed without affecting device operation.

NOTE 7: Supporting the two physical registers for Burst Length: MR1 OP[1:0] as optional feature. Applications requiring support of both vendor options shall assure that both FSP-OP[0] and FSP-OP[1] are set to the same code. Refer to vendor datasheets for detail.

## Notes:

1. (Ref. See Latency Code Frequency Table for allowable Frequency Ranges for RL/WL/nWR/nRTP, available in next revision of this document).
2. After a MRW to set the Write Leveling Enable bit (OP[7]=1B), the LPDDR4-SDRAM device remains in the MRW state until another MRW command clears the bit (OP[7]=0B). No other commands are allowed until the Write Leveling Enable bit is cleared.
3. There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.

**Notes:**

- All values are "typical". The actual value after calibration will be within the specified tolerance for a given voltage and temperature. Re-calibration may be required as voltage and temperature vary.
- There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.
- There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. The device will operate only according to the values stored in the registers for the active set point, i.e., the set point determined by the state of the FSP-OP bit (MR13 OP[7]). The values in the registers for the inactive set point will be ignored by the device, and may be changed without affecting device operation.
- For dual channel devices, PU-CAL setting is required as the same value for both Ch.A and Ch.B before issuing ZQ Cal start command.
- Refer to the supplier data sheet for vendor specific function. 1.5\*tCK apply > 1.6GHz clock.
- If MR3 OP[2] is set to 1b then PPR protection mode is enabled. The PPR Protection bit is a sticky bit and can only be set to 0b by a power on reset.  
MR4 OP[4] controls entry to PPR Mode. If PPR protection is enabled then DRAM will not allow writing of 1 to MR4 OP[4].

**Notes:**

- The refresh rate for each MR4-OP[2:0] setting applies to tREFI, tREFIpb, and tREFW. OP[2:0]=011B corresponds to a device temperature of 85 °C. Other values require either a longer (2x, 4x) refresh interval at lower temperatures, or a shorter (0.5x, 0.25x) refresh interval at higher temperatures. If OP[2]=1B, the device temperature is greater than 85 °C.
- At higher temperatures (>85 °C), AC timing derating may be required. If derating is required the LPDDR4-SDRAM will set OP[2:0]=110B.
- DRAM vendors may or may not report all of the possible settings over the operating temperature range of the device. Each vendor guarantees that their device will work at any temperature within the range using the refresh interval requested by their device.
- The device may not operate properly when OP[2:0]=000B or 111B.
- Post-package repair can be entered or exited by writing to OP[4].
- When OP[7]=1, the refresh rate reported in OP[2:0] has changed since the last MR4 read. A mode register read from MR4 will reset OP[7] to '0'.
- OP[7] = 0 at power-up. OP[2:0] bits are valid after initialization sequence(Te).
- See the section on "temperature Sensor" for information on the recommended frequency of readingMR4.
- OP[6:3] bits that can be written in this register. All other bits will be ignored by the DRAM during a MRW to this register.
- Refer to the supplier data sheet for vender specific function.
- Self Refresh abort feature is available for higher density devices starting with 12Gb device.

NOTE 1: All values are "typical". The actual value after calibration will be within the specified tolerance for a given voltage and temperature. Re-calibration may be required as voltage and temperature vary.

NOTE 2: There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.

NOTE 3: There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. The device will operate only according to the values stored in the registers for the active set point, i.e., the set point determined by the state of the FSP-OP bit (MR13 OP[7]). The values in the registers for the inactive set point will be ignored by the device, and may be changed without affecting device operation.

NOTE 4: ODT for non-target DRAM is optional.

NOTE 1: This register controls the V<sub>REF</sub>(CA) levels. Refer to [Table 15](#) - V<sub>REF</sub> Settings for Range[0] and Range[1] for actual voltage of V<sub>REF</sub>(CA).

NOTE 2: A read to this register places the contents of OP[7:0] on DQ[7:0]. Any RFU bits and unused DQ's shall be set to '0'. See the section on MRR Operation.

NOTE 3: A write to OP[5:0] sets the internal V<sub>REF</sub>(CA) level for FSP[0] when MR13 OP[6]=0B, or sets FSP[1] when MR13 OP[6]=1B. The time required for V<sub>REF</sub>(CA) to reach the set level depends on the step size from the current level to the new level. See the section on V<sub>REF</sub>(CA) training for more information.

NOTE 4: A write to OP[6] switches the LPDDR4-SDRAM between two internal V<sub>REF</sub>(CA) ranges. The range (Range[0] or Range[1]) must be selected when setting the V<sub>REF</sub>(CA) register. The value, once set, will be retained until overwritten, or until the next power-on or RESET event.

NOTE 5: There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.

NOTE 6: There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. The device will operate only according to the values stored in the registers for the active set point, i.e., the set point determined by the state of the FSP-OP bit (MR13 OP[7]). The values in the registers for the inactive set point will be ignored by the device, and may be changed without affecting device operation.

NOTE 1 These values may be used for MR12 OP[5:0] to set the V<sub>REF</sub>(CA) levels in the LPDDR4-SDRAM.

NOTE 2 The range may be selected in the MR12 register by setting OP[6] appropriately.

NOTE 3 The MR12 registers represents either FSP[0] or FSP[1]. Two frequency-set-points each for CA and DQ are provided to allow for faster switching between terminated and un-terminated operation, or between different high frequency setting which may use different terminations values.

FSP-OP (Frequency Set Point Operation Mode)		OP[7]	0B: Frequency-Set-Point[0] (default) 1B: Frequency-Set-Point [1]	8

**Notes:**

1. A write to set OP[0]=1 causes the LPDDR4-SDRAM to enter the Command Bus Training mode. When OP[0]=1 and CKE goes LOW, commands are ignored and the contents of CA[5:0] are mapped to the DQ bus. CKE must be brought HIGH before doing a MRW to clear this bit (OP[0]=0) and return to normal operation. See the Command Bus Training section for more information.
2. When set, the LPDDR4-SDRAM will output the VREF(CA) and VREF(D) voltages on D pins. Only the “active” frequency-set-point, as defined by MR13 OP[7], will be output on the DQ pins. This function allows an external test system to measure the internal VREF levels. The DQ pins used for VREF output are vendor specific.
3. When OP[3]=1, the VREF circuit uses a high-current mode to improve VREF settling time.
4. MR13 OP4 RRO bit is valid only when MR0 OP0 = 1. For LPDDR4 devices with MR0 OP0 = 0, MR4 OP[2:0] bits are not dependent on MR13 OP4.
5. When OP[4] = 0, only 001b and 010b in MR4 OP[2:0] are disabled. LPDDR4 devices must report 011b instead of 001b or 010b in this case. Controller should follow the refresh mode reported by MR4 OP[2:0], regardless of RRO setting. TCSR function does not depend on RRO setting.
6. When enabled (OP[5]=0B) data masking is enabled for the device. When disabled (OP[5]=1B), masked write command is illegal. See 4.16, LPDDR4 Data Mask (DM) and Data Bus Inversion (DBI<sub>dc</sub>) Function.
7. FSP-WR determines which frequency-set-point registers are accessed with MRW commands for the following functions such as VREF(CA) Setting, VREF(CA) Range, VREF(DQ) Setting, VREF(DQ) Range. For more information, refer to 4.30, Frequency Set Point.
8. FSP-OP determines which frequency-set-point register values are currently used to specify device operation for the following functions such as VREF(CA) Setting, VREF(CA) Range, VREF(DQ) Setting, VREF(DQ) Range. For more information, refer to 4.30 Frequency Set Point section.

1. This register controls the VREF(DQ) levels for Frequency-Set-Point[1:0]. Values from either VR(DQ)[0] or VR(dq)[1] may be selected by setting OP[6] appropriately.
2. A read (MRR) to this register places the contents of OP[7:0] on DQ[7:0]. Any RFU bits and unused DQ's shall be set to '0'. See the section on MRR Operation.
3. A write to OP[5:0] sets the internal VREF(DQ) level for FSP[0] when MR13 OP[6]=0B, or sets FSP[1] when MR13 OP[6]=1B. The time required for VREF(DQ) to reach the set level depends on the step size from the current level to the new level. See the section on VREF(DQ) training for more information.
4. A write to OP[6] switches the LPDDR4-SDRAM between two internal VREF(DQ) ranges. The range (Range[0] or Range[1]) must be selected when setting the VREF(DQ) register. The value, once set, will be retained until overwritten, or until the next power-on or RESET event.
5. There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.

**Notes:**

1. This register will invert the DQ Calibration pattern found in MR32 and MR40 for any single DQ, or any combination of DQ's. Example: If MR15 OP[7:0]=00010101B, then the DQ Calibration patterns transmitted on DQ[7,6,5,3,1] will not be inverted, but the DQ Calibration patterns transmitted on DQ[4,2,0] will be inverted.
2. DMI[0] is not inverted, and always transmits the "true" data contained in MR32/MR40.
3. No Data Bus Inversion (DBI) function is enacted during DQ Read Calibration, even if DBI is enabled in MR3-OP[6].

DQS Oscillator (WR Training DQS Oscillator)	Read-only	OP[7:0]	0 - 255 LSB DRAM DQS Oscillator Count	1,2,3

**Notes:**

1. MR18 reports the LSB bits of the DRAM DQS Oscillator count. The DRAM DQS Oscillator count value is used to train DQS to the DQ data valid window. The value reported by the DRAM in this mode register can be used by the memory controller to periodically adjust the phase of DQS relative to DQ.
2. Both MR18 and MR19 must be read (MRR) and combined to get the value of the DQS Oscillatorcount.
3. A new MPC [Start DQS Oscillator] should be issued to reset the contents ofMR18/MR19.

Upper-Byte Invert for DQ Calibration	Write-only	OP[7:0]	The following values may be written for any operand OP[7:0], and will be applied to the corresponding DQ locations DQ[15:8] within a byte lane:  0B: Do not invert 1B: Invert the DQ Calibration patterns in MR32 and MR40  Default value for OP[7:0] = 55H	1,2

**Notes:**

1. This register will invert the DQ Calibration pattern found in MR32 and MR40 for any single DQ, or any combination of DQ's. Example: If MR20 OP[7:0]=00010101B, then the DQ Calibration patterns transmitted on DQ[15,14,13,11,9] will not be inverted, but the DQ Calibration patterns transmitted on DQ[12,10,8] will be inverted.
2. DMI[1] is not inverted, and always transmits the "true" data contained in MR32/MR40.
3. No Data Bus Inversion (DBI) function is enacted during DQ Read Calibration, even if DBI is enabled in MR3-OP[6].

**Notes:**

- All values are "typical".
- There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. Only the registers for the set point determined by the state of the FSP-WR bit (MR13 OP[6]) will be written to with an MRW command to this MR address, or read from with an MRR command to this address.
- There are two physical registers assigned to each bit of this MR parameter, designated set point 0 and set point 1. The device will operate only according to the values stored in the registers for the active set point, i.e., the set point determined by the state of the FSP-OP bit (MR13 OP[7]). The values in the registers for the inactive set point will be ignored by the device, and may be changed without affecting device operation.
- When OP[3]=1, then the CK signals will be terminated to the value set by MR11-OP[6:4] regardless of the state of the ODT\_CA bond pad. This overrides the ODT\_CA bond pad for configurations where CA is shared by two or more DRAMs but CK is not, allowing CK to terminate on all DRAMs.
- When OP[4]=1, then the CS signal will be terminated to the value set by MR11-OP[6:4] regardless of the state of the ODT\_CA bond pad. This overrides the ODT\_CA bond pad for configurations where CA is shared by two or more DRAMs but CS is not, allowing CS to terminate on all DRAMs.
- For system configurations where the CK, CS, and CA signals are shared between packages, the package design should provide for the ODT\_CA ball to be bonded on the system board outside of the memory package. This provides the necessary control of the ODT function for all die with shared Command Bus signals.
- When OP[5]=0, CA[5:0] will terminate when the ODT\_CA bond pad is HIGH and MR11-OP[6:4] is VALID, and disables termination when ODT\_CA is LOW or MR11-OP[6:4] is disabled. When OP[5]=1, termination for CA[5:0] is disabled, regardless of the state of the ODT\_CA bond pad or MR11-OP[6:4].
- To ensure proper operation in a multi-rank configuration, when CA, CK or CS ODT is enabled via MR11 OP[6:4] and also via MR22 or CA-ODT pad setting, the rank providing ODT will continue to terminate the command bus in all DRAM states including Active Self Refresh, Self Refresh Power-down, Active Power-down and Precharge Power-down.

**Notes:**

1. The pattern contained in MR40 is concatenated to the end of MR32 and transmitted on DQ[15:0] and DMI[1:0] when DQ Read Calibration is initiated via a MPC command. The pattern transmitted serially on each data lane, organized "little endian" such that the low-order bit in a byte is transmitted first. If the data pattern in MR40 is 27<sub>H</sub>, then the first bit transmitted will be a '1', followed by '1', '1', '0', '0', '1', '0', and '0'. The bit stream will be 00100111<sub>B</sub>.
2. MR15 and MR20 may be used to invert the MR32/MR40 data patterns on the DQ pins. See MR15 and MR20 for more information. Data is never inverted on the DMI[1:0] pins.
3. The data pattern is not transmitted on the DMI[1:0] pins if DBI-RD is disabled via MR3-OP[6].
4. No Data Bus Inversion (DBI) function is enacted during DQ Read Calibration, even if DBI is enabled in MR3-OP[6].

## 1.9 Refresh Requirement

Between SRX command and SRE command, at least one extra refresh command is required. After the DRAM Self Refresh Exit command, in addition to the normal Refresh command at tREFI interval, the LPDDR4 DRAM requires minimum of one extra Refresh command prior to Self Refresh Entry command.

**Table 19 - Refresh Requirement Parameters per die for Dual Channel SDRAM devices**

Refresh Requirements		Symbol	2Gb	2Gb	4Gb	4Gb	8Gb	Units	Notes
Density per Channel			1Gb	2Gb		4Gb			
Number of banks per channel			8						
Refresh Window (tREFW) (TCASE ≤ 85°C)	tREFW		32					ms	
Refresh Window (tREFW) (1/2 Rate Refresh)	tREFW		16					ms	
Refresh Window (tREFW) (1/4 Rate Refresh)	tREFW		8					ms	
Required Number of REFRESH Commands in a tREFW window	R		8192					-	
Average Refresh Interval	REFAB	tREFI	3.904					us	
	REFPB	tREFIpb	488					ns	
Refresh Cycle Time (All Banks)	tRFCab		130		180			ns	
Refresh Cycle Time (Per Bank)	tRFCpb		60		90			ns	

NOTE1 Refresh for each channel is independent of the other channel on the die, or other channels in a package. Power delivery in the user's system should be verified to make sure the DC operating conditions are maintained when multiple channels are refreshed simultaneously.

NOTE2 Self refresh abort feature is available for higher density devices starting with 12 Gb device and tXSR<sub>abort</sub>(min) is defined as tRFCpb + 17.5ns.

## 2 Operating Conditions and Interface Specification

### 2.1 Absolute Maximum Ratings

Stresses greater than those listed may cause permanent damage to the device.

This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Table 20 - Absolute Maximum DC Ratings**

Parameter	Symbol	Min	Max	Units	Notes
V <sub>DD1</sub> supply voltage relative to V <sub>ss</sub>	V <sub>DD1</sub>	-0.4	2.1	V	1
V <sub>DD2</sub> supply voltage relative to V <sub>ss</sub>	V <sub>DD2</sub>	-0.4	1.5	V	1
V <sub>DDQ</sub> supply voltage relative to V <sub>SSQ</sub>	V <sub>DDQ</sub>	-0.4	1.5	V	1
Voltage on any ball except V <sub>DD1</sub> relative to V <sub>ss</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-0.4	1.5	V	
Storage Temperature	TSTG	-55	125	°C	2

**Notes:**

1. See "Power-Ramp" for relationships between power supplies.
2. Storage Temperature is the case surface temperature on the center/top side of the LPDDR4 device. For the measurement conditions, please refer to JESD51-2.

## 2.2 AC and DC Operating Conditions

**Table 21 - Recommended DC Operating Conditions**

DRAM	Symbol	Min	Typ	Max	Unit	Notes
Core 1 Power	V <sub>DD1</sub>	1.70	1.80	1.95	V	1,2
Core 2 Power/Input Buffer Power	V <sub>DD2</sub>	1.06	1.10	1.17	V	1,2,3
I/O Buffer Power	V <sub>DDQ</sub>	1.06	1.10	1.17	V	2,3

**Notes:**

- V<sub>DD1</sub> uses significantly less current than V<sub>DD2</sub>.
- The voltage range is for DC voltage only. DC is defined as the voltage supplied at the DRAM and is inclusive of all noise up to 20MHz at the DRAM package ball.
- VdIVW and TdIVW limits described elsewhere in this document apply for voltage noise on supply voltages of up to 45 mV (peak-to-peak) from DC to 20MHz.

**Table 22 - Input Leakage Current**

Parameter/Condition	Symbol	Min	Max	Unit	Notes
Input Leakage current	I <sub>L</sub>	-4	4	uA	1,2

**Notes:**

- For CK<sub>t</sub>, CK<sub>c</sub>, CKE, CS, CA, ODT<sub>CA</sub> and RESET<sub>n</sub>. Any input 0V ≤ VIN ≤ V<sub>DD2</sub> (All other pins not under test = 0V).
- CA ODT is disabled for CK<sub>t</sub>, CK<sub>c</sub>, CS, and CA.

**Table 23 - Input/Output Leakage Current**

Parameter/Condition	Symbol	Min	Max	Unit	Notes
Input/Output Leakage current	I <sub>oz</sub>	-5	5	uA	1,2

**Notes:**

- For DQ, DQS<sub>t</sub>, DQS<sub>c</sub> and DM I. Any I/O 0V ≤ VOUT ≤ V<sub>DDQ</sub>.
- I/Os status are disabled: High Impedance and ODT Off.

**Table 24 - Operating Temperature Range**

Parameter/Condition	Symbol	Min	Max	Unit
Standard	T <sub>OPER</sub>	-40	85	°C
Elevated		85	105	°C

**Notes:**

- Operating Temperature is the case surface temperature on the center-top side of the LPDDR4 device. For the measurement conditions, please refer to JESD51-2.
- Some applications require operation of LPDDR4 in the maximum temperature conditions in the Elevated Temperature Range between 85 °C and 105 °C case temperature. For LPDDR4 devices, de-rating may be necessary to operate in this range. See MR4.
- Either the device case temperature rating or the temperature sensor may be used to set an appropriate refresh rate, determine the need for AC timing de-rating and/or monitor the operating temperature. When using the temperature sensor, the actual device case temperature may be higher than the T<sub>OPER</sub> rating that applies for the Standard or Elevated Temperature Ranges. For example, T<sub>CASE</sub> may be above 85°C when the temperature sensor indicates a temperature of less than 85°C.

## 2.3 Interface Capacitance

**Table 25 - Input/output capacitance**

Parameter	Symbol		LPDDR4 1600-3200	Units	Notes
Input capacitance, CK_t and CK_c	CCK	Min	0.5	pF	1,2

		Max	0.1		
Input/output capacitance, ZQ pin	CZQ	Min	0.0	pF	1,2
		Max	5.0		

**Notes:**

1. This parameter applies to die device only (does not include package capacitance).
2. This parameter is not subject to production test. It is verified by design and characterization. The capacitance is measured according to JEP147 (Procedure for measuring input capacitance using a vector network analyzer (VNA) with  $V_{DD1}$ ,  $V_{DD2}$ ,  $V_{DDQ}$ ,  $VSS$ ,  $VSSQ$  applied and all other pins floating).
3. Absolute value of CCK\_t, CCK\_c.
4. CI applies to CS\_n, CKE, CA0~CA5.
5.  $CDI = CI - 0.5 * (CCK_t + CCK_c)$
6. DMI loading matches DQ and DQS.
7. Absolute value of CDQS\_t and CDQS\_c.
8.  $CDIO = CIO - 0.5 * (CDQS_t + CDQS_c)$  in byte-lane.

## 3 Speed Bins, AC Timing and IDD

### 3.1 Speed Bins

**Table 26 - Read and Write Latencies**

Read Latency		Write Latency		nWR	nRTP	Lower Clock Frequency Limit [MHz] (>)	Upper Clock Frequency Limit [MHz] (≤)	Notes
No DBI	w/DBI	Set A	Set B

20	22	10	18	20	8	800	1066	
24	28	12	22	24	10	1066	1333	
28	32	14	26	30	12	1333	1600	

**Notes:**

- The LPDDR4 SDRAM device should not be operated at a frequency above the Upper Frequency Limit, or below the Lower Frequency Limit, shown for each RL, WL, nRTP, or nWR value.
- DBI for Read operations is enabled in MR3 OP[6]. When MR3 OP[6]=0, then the "No DBI" column should be used for Read Latency. When MR3 OP[6]=1, then the "w/DBI" column should be used for Read Latency.
- Write Latency Set "A" and Set "B" is determined by MR2 OP[6]. When MR2 OP[6]=0, then Write Latency Set "A" should be used. When MR2 OP[6]=1, then Write Latency Set "B" should be used.
- The programmed value of nWR is the number of clock cycles the LPDDR4 SDRAM device uses to determine the starting point of an internal Precharge operation after a Write burst with AP (Auto Pre-charge). It is determined by RU(tWR/tCK).
- The programmed value of nRTP is the number of clock cycles the LPDDR4 SDRAM device uses to determine the starting point of an internal Precharge operation after a Read burst with AP (Auto Pre-charge). It is determined by RU(tRTP/tCK).
- nRTP shown in this Table 26 is valid for BL16 only. For BL32, the SDRAM will add 8 clocks to the nRTP value before starting a precharge.

The ODT Mode is enabled if MR11 OP[3:0] are non-zero. In this case, the value of RTT is determined by the settings of those bits.

The ODT Mode is disabled if MR11 OP[3] = 0.

**Table 27 - ODTLon and ODTLoff Latency**

ODTLon Latency <sup>1</sup>		ODTLoff Latency <sup>2</sup>		Lower Clock Frequency Limit [MHz] (>)	Upper Clock Frequency Limit [MHz] (≤)
tWPRE = 2tCK					
WL Set "A"	WL Set "B"	WL Set "A"	WL Set "B"		
4	6	20	22	10	266
4	6	20	22	266	533
4	6	20	22	533	800
4	12	20	28	800	1066
4	14	22	32	1066	1333
6	18	24	36	1333	1600

**Notes:**

- ODTLon is referenced from CAS-2 command.
- ODTLoff as shown in table assumes BL=16. For BL32, 8 tCK should be added.

The ODT Mode for non-target DRAM ODT control is enabled if MR11 OP[7,3] is set to a non-zero value.

The ODT Mode for non-target DRAM is disabled if MR11 OP[7,3] = 00B.

**Table 28 - ODTLon\_rd and ODTLoff\_rd Latency Values (MR0 [OP1=0] Normal Latency Support)**

ODTLon_rd Latency		ODTLoff_rd Latency <sup>1,2</sup>		Lower Clock Frequency Limit[Mhz] (>)	Upper Clock Frequency Limit[Mhz] (≤)
No DBI	w/DBI	No DBI	w/ DBI		
14	16	32	34	10	266
14	16	32	34	266	533
14	16	32	34	533	800
14	16	32	34	800	1066
18	22	36	40	1066	1333
22	26	42	46	1333	1600

**Notes:**

1. ODTLoff\_rd assumes BL=16, For BL32, 8tCK should be added.
2. ODTLoff\_rd assumes a fixed tRPST of 1.5tCK

## 3.2 AC Timing

**Table 29 - Clock AC Timing**

**Notes:**

1. The deterministic component of the total timing. Measurement method tdb.
2. This parameter will be characterized and guaranteed by design.
3. This parameter is function of input clock jitter. These values assume the min tCH(abs) and tCL(abs). When the input clock jitter min tCH(abs) and tCL(abs) is 0.44 or greater of tck(avg) the min value of tQSL will be tCL(abs)-0.04 and tQSH will be tCH(abs) -0.04.
4. tQSL describes the instantaneous differential output low pulse width on DQS<sub>t</sub> - DQS<sub>c</sub>, as it measured the next rising edge from an arbitrary falling edge.
5. tQSH describes the instantaneous differential output high pulse width on DQS<sub>t</sub> - DQS<sub>c</sub>, as it measured the next rising edge from an arbitrary falling edge.
6. This parameter is function of input clock jitter. These values assume the min tCH(abs) and tCL(abs). When the input clock jitter min tCH(abs) and tCL(abs) is 0.44 or greater of tck(avg) the min value of tQSL will be tCL(abs)-0.04 and tQSH will be tCH(abs) -0.04.

CK to DQS Rank to Rank variation	tDQSCK_rank2rank	-	1.0	ns	4,5

**Notes:**

- Includes DRAM process, voltage and temperature variation. It includes the AC noise impact for frequencies > 20 MHz and max voltage of 45 mV pk-pk from DC-20 MHz at a fixed temperature on the package. The voltage supply noise must comply to the component Min-Max DC Operating conditions.
- tDQSCK\_temp max delay variation as a function of Temperature.
- tDQSCK\_volt max delay variation as a function of DC voltage variation for V<sub>DDQ</sub> and V<sub>DD2</sub>. tDQSCK\_volt should be used to calculate timing variation due to V<sub>DDQ</sub> and V<sub>DD2</sub> noise < 20 MHz. Host controller do not need to account for any variation due to V<sub>DDQ</sub> and V<sub>DD2</sub> noise > 20 MHz. The voltage supply noise must comply to the component Min-Max DC Operating conditions. The voltage variation is defined as the  $\text{Max}\{\text{abs}\{tDQSCK_{\text{min}}@V1 - tDQSCK_{\text{max}}@V2\}, \text{abs}\{tDQSCK_{\text{max}}@V1 - tDQSCK_{\text{min}}@V2\}\} / \text{abs}\{V1 - V2\}$ . For tester measurement V<sub>DDQ</sub> = V<sub>DD2</sub> is assumed.
- The same voltage and temperature are applied to tDQS2CK\_rank2rank.
- tDQSCK\_rank2rank parameter is applied to multi-ranks per byte lane within a package consisting of the same design dies.

tDQS2DQ_rank2rank	DQ to DQS offset rank to rank variation	-	200	-	200	-	200	ps	14,15

**Notes:**

1. Data Rx mask voltage and timing parameters are applied per pin and includes the DRAM DQ to DQS voltage AC noise impact for frequencies >20 MHz and max voltage of 45mv pk-pk from DC-20MHz at a fixed temperature on the package. The voltage supply noise must comply to the component Min-Max DC operating conditions.
2. The design specification is a BER <TBD. The BER will be characterized and extrapolated if necessary using a dual dirac method.
3. Rx mask voltage VdIVW total(max) must be centered around Vcent\_DQ(pin\_mid).
4. Vcent\_DQ must be within the adjustment range of the DQ internal Vref.
5. DQ only input pulse amplitude into the receiver must meet or exceed VIHL AC at any point over the total UI. No timing requirement above level. VIHL AC is the peak to peak voltage centered around Vcent\_DQ(pin\_mid) such that VIHL\_AC/2 min must be met both above and below Vcent\_DQ.
6. DQ only minimum input pulse width defined at the Vcent\_DQ(pin\_mid).
7. DQ to DQS offset is within byte from DRAM pin to DRAM internal latch. Includes all DRAM process, voltage and temperature variation.
8. DQ to DQ offset defined within byte from DRAM pin to DRAM internal latch for a given component.
9. TDQS2DQ max delay variation as a function of temperature.
10. TDQS2DQ max delay variation as a function of the DC voltage variation for V<sub>DDQ</sub> and V<sub>DD2</sub>. It includes the V<sub>DDQ</sub> and V<sub>DD2</sub> AC noise impact for frequencies > 20MHz and max voltage of 45mv pk-pk from DC-20MHz at a fixed temperature on the package. For tester measurement V<sub>DDQ</sub> = V<sub>DD2</sub> is assumed.
11. Input slew rate over VdIVW Mask centered at Vcent\_DQ(pin\_mid).
12. Rx mask defined for a one pin toggling with other DQ signals in a steady state.
13. VIHL\_AC does not have to be met when no transitions are occurring.
14. The same voltage and temperature are applied to tDQS2DQ\_rank2rank.
15. tDQS2DQ\_rank2rank parameter is applied to multi-ranks per byte lane within a package consisting of the same design dies.

TclPW	CA input pulse width	0.55		0.6		UI	5
SRIN_clVW	Input Slew Rate over VclVW	1	7	1	7	V/ns	6

**Notes:**

1. CA Rx mask voltage and timing parameters at the pin including voltage and temperature drift.
2. Rx mask voltage VclVW total(max) must be centered around Vcent\_CA(pin mid).
3. Vcent\_CA must be within the adjustment range of the CA internal Vref.
4. CA only input pulse signal amplitude into the receiver must meet or exceed VIHL AC at any point over the total UI. No timing requirement above level. VIHL AC is the peak to peak voltage centered around Vcent\_CA(pin mid) such that VIHL\_AC/2 min must be met both above and below Vcent\_CA.
5. CA only minimum input pulse width defined at the Vcent\_CA(pin mid).
6. Input slew rate over VclVW Mask centered at Vcent\_CA(pin mid).
7. VIHL\_AC does not have to be met when no transitions are occurring.

Minimum Self Refresh Time	tSR	Min	Max(15ns, 3tCK)	ns	1
Exit Self Refresh to Valid commands	tXSR	Min	Max(tRFCab + 7.5ns, 2tCK)	ns	1,2

**Notes:**

- Delay time has to satisfy both analog time(ns) and clock count(tCK). It means that tESCKE will not expire until CK has toggled through at least 3 full cycles (3 \*tCK) and 1.75ns has transpired.
- MRR-1, CAS-2, DES, MPC, MRW-1 and MRW-2 except PASR Bank/Segment setting are only allowed during this period.

**Table 41 - Command Bus Training AC Timing**

Parameter	Symbol	Min/ Max	Data Rate			Unit	Notes

Exit Command Bus Training Mode to next valid command delay	tXCBT_Short	Min	Max(5nCK, 200ns)			-	3
	tXCBT_Middle	Min	Max(5nCK, 200ns)			-	
	tXCBT_Long	Min	Max(5nCK, 250ns)			-	

**Notes:**

1. DQS\_t has to retain a low level during tDQSCKE period, as well as DQS\_c has to retain a high level.
2. If tCACD is violated, the data for samples which violate tCACD will not be available, except for the last sample (where tCACD after this sample is met). Valid data for the last sample will be available after tADR.
3. Exit Command Bus Training Mode to next valid command delay Time depends on value of VREF(CA) setting: MR12 OP[5:0] and VREF(CA) Range: MR12 OP[6] of FSP-OP 0 and 1. Additionally exit Command Bus Training Mode to next valid command delay Time may affect VREF(DQ) setting. Settling time of VREF(DQ) level is same as VREF(CA) level.
